

Mer vann og mer uvær?

Utfordringer for vannkraft innen hydrologi og klima

Sjur Kolberg, SINTEF Energi

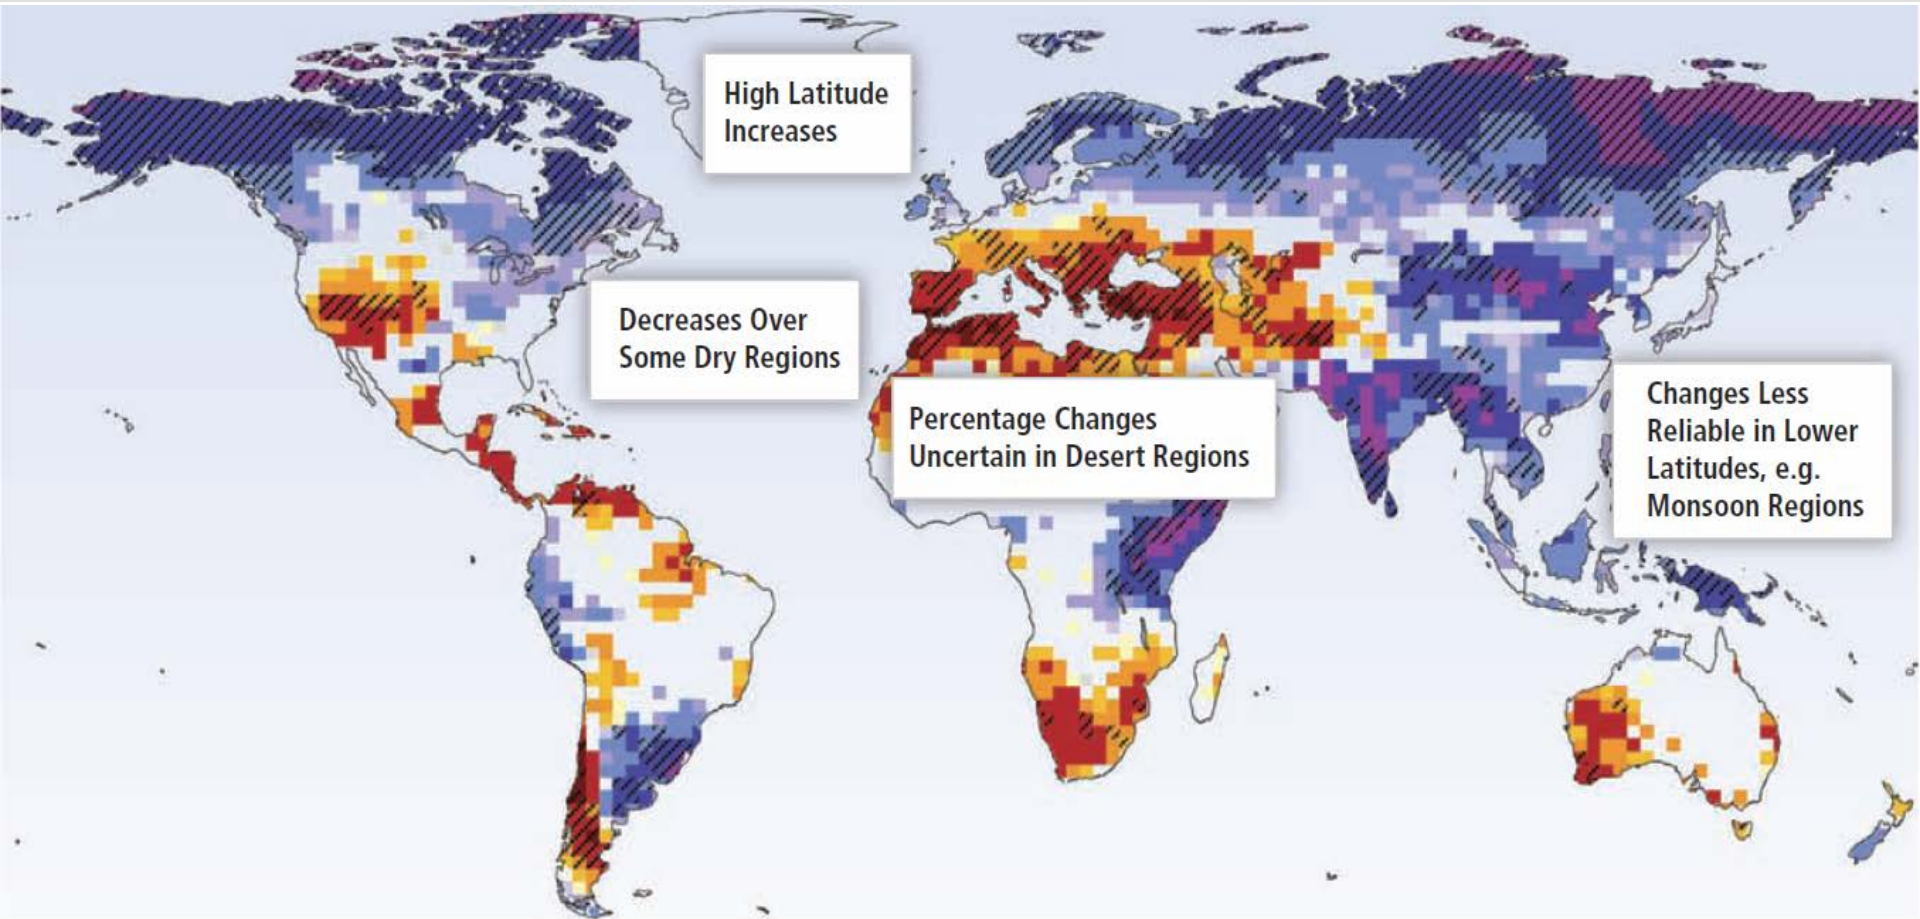

I all hovedsak stjålet fra: Yisak Sultan Abdella, Knut Alfredsen, Idar Barstad, Thibault Boissy, Julie Charmasson, Haregewoin Haile Chernet, Kolbjørn Engeland, Anders Finstad, Hans-Petter Fjeldstad, Torbjørn Forseth, Solomon Gebre, Teklu Tesfaye Hailegeorgis, Byman Hamududu, Atle Harby, Richard Hedger, Ånund Killingtveit, Sara Martino, Julian Sauterlaute, Line Sundt-Hansen, Netra Prasad Timalisina, Lena S. Tøfte, Ola Ugedal, Peggy Zinke,...

CEDREN

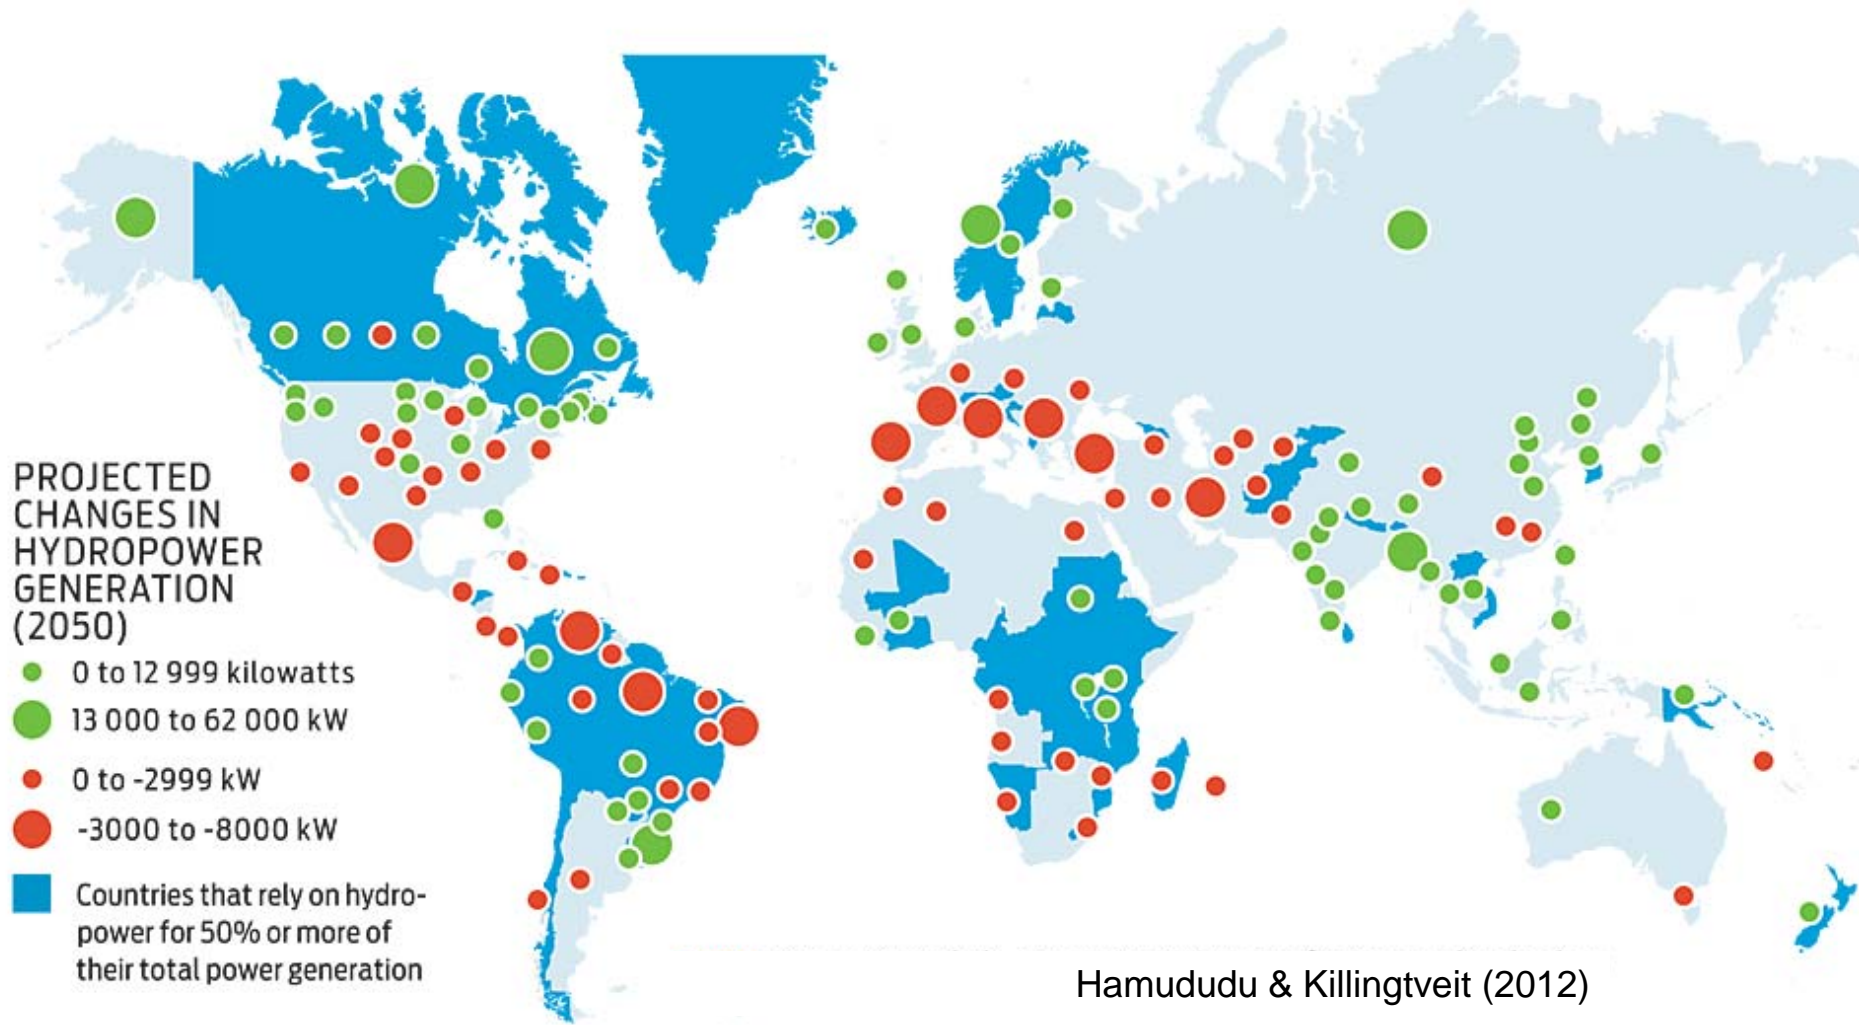

Centre for Environmental Design of Renewable Energy

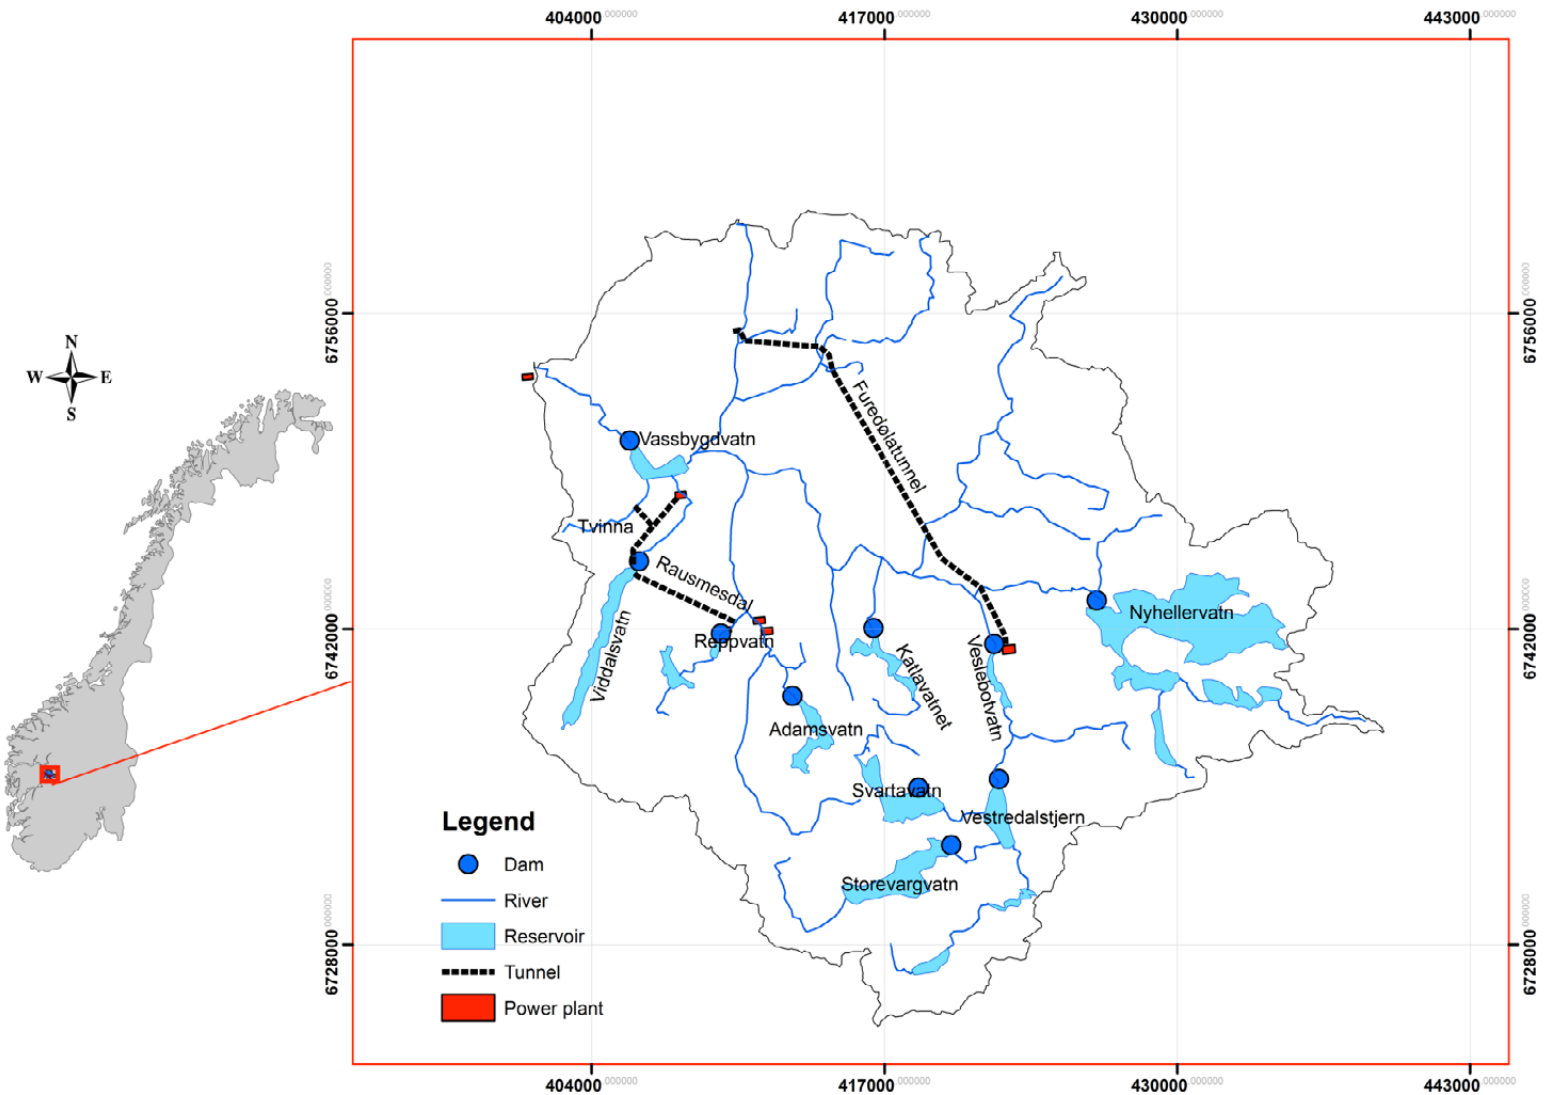

Climate Change will have impact on Water Resources

Hydropower and Climate Change

Lokale verknader på kraftressursar

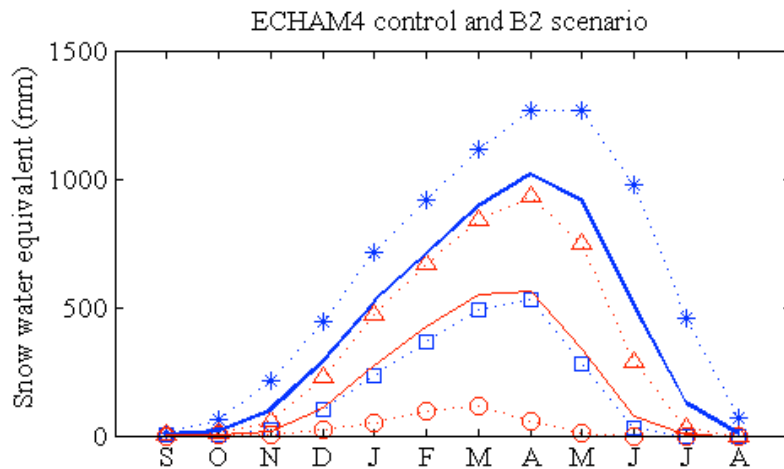

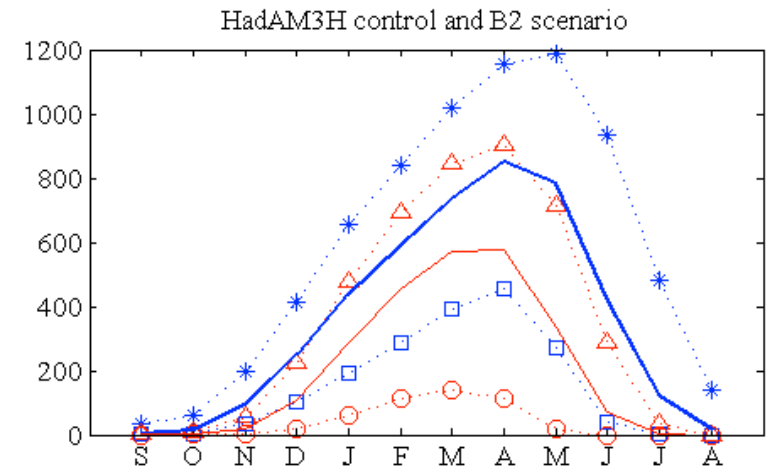

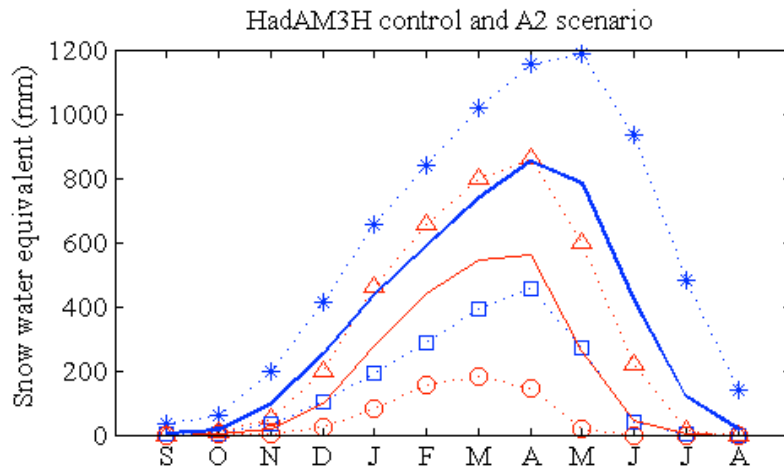

Chernet et al. 2013, Journal of water and climate change

Tilsig simulert frå nedskalerte klimadata

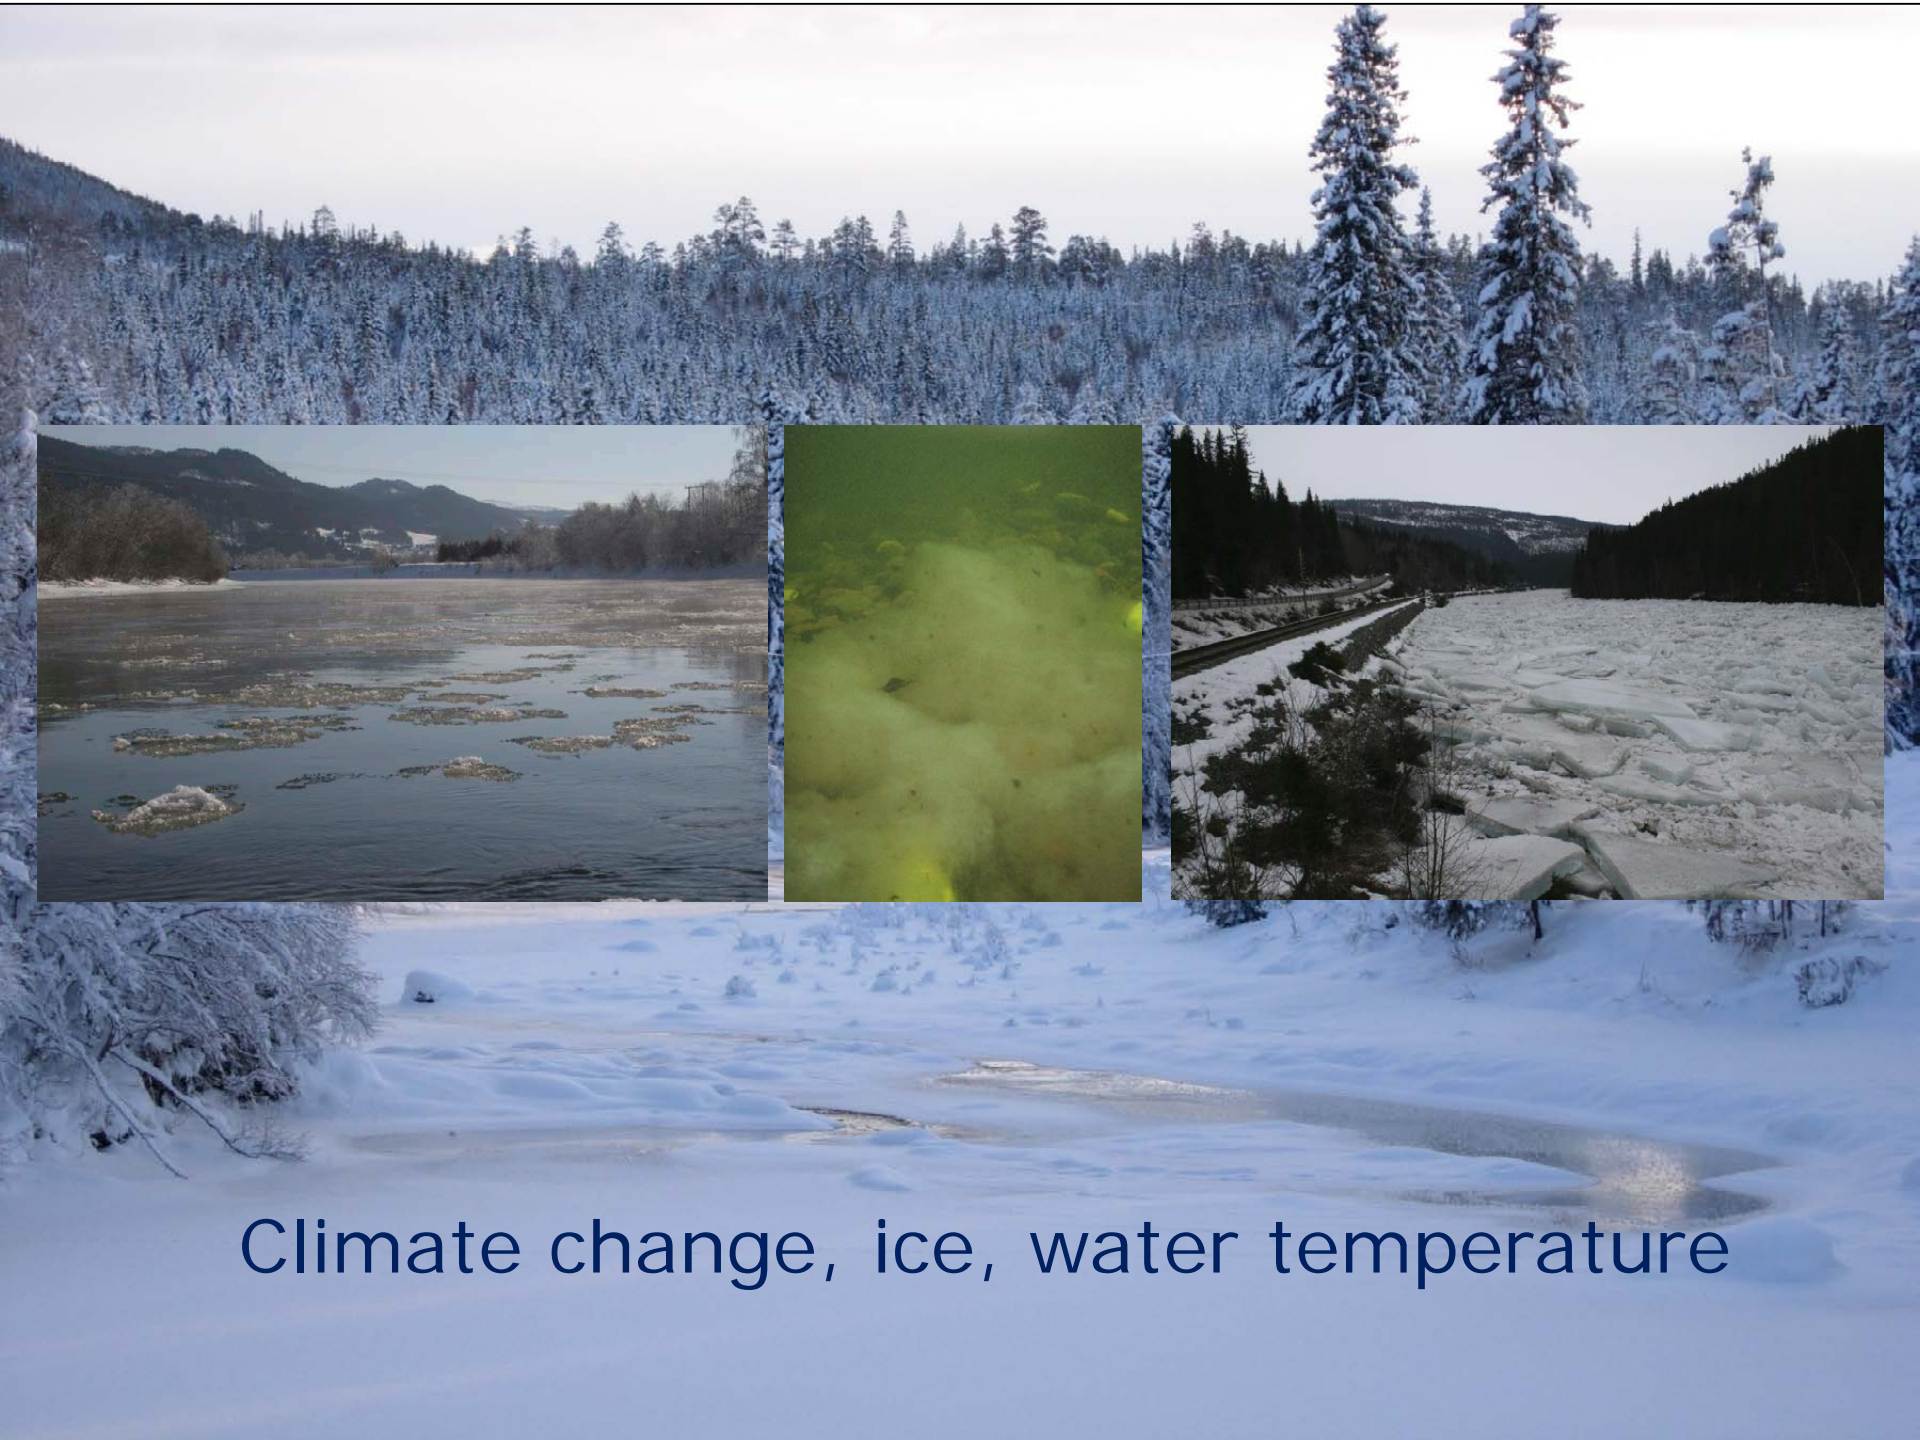

Chernet et al. 2013, *Journal of water and climate change*

Climate change, ice, water temperature

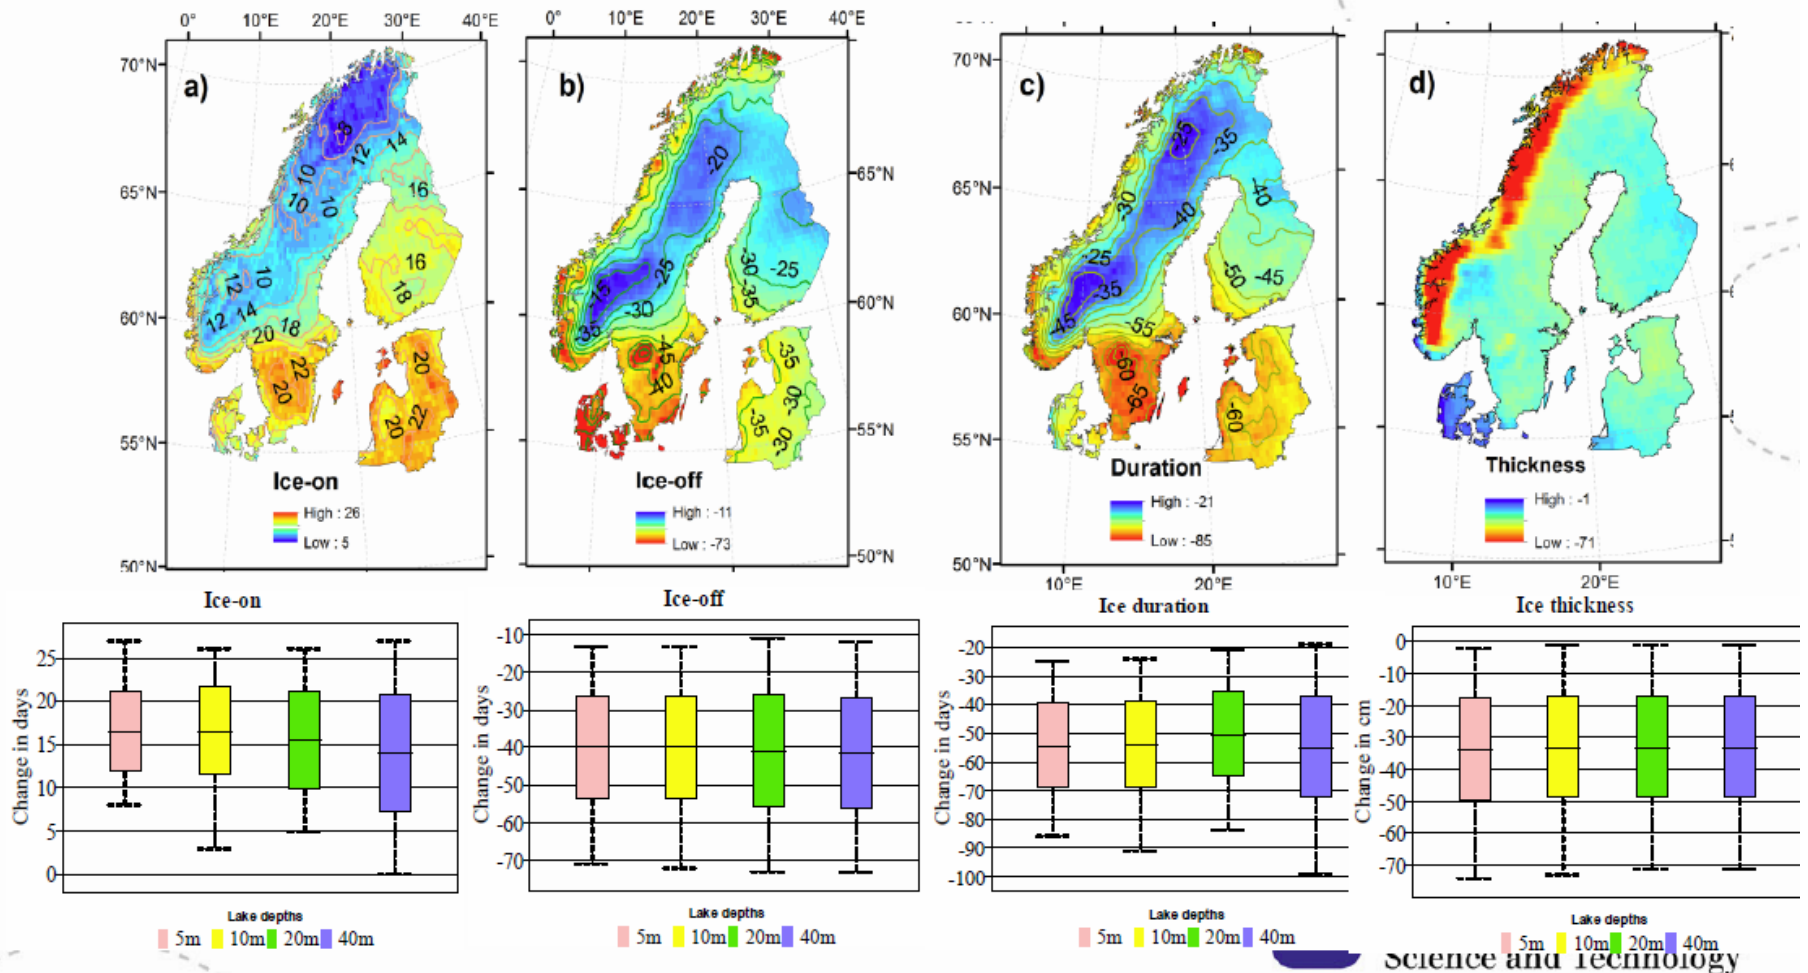

Current (1961-1990)

Future (2041-2070)

Endringar i innsjøis i framtida

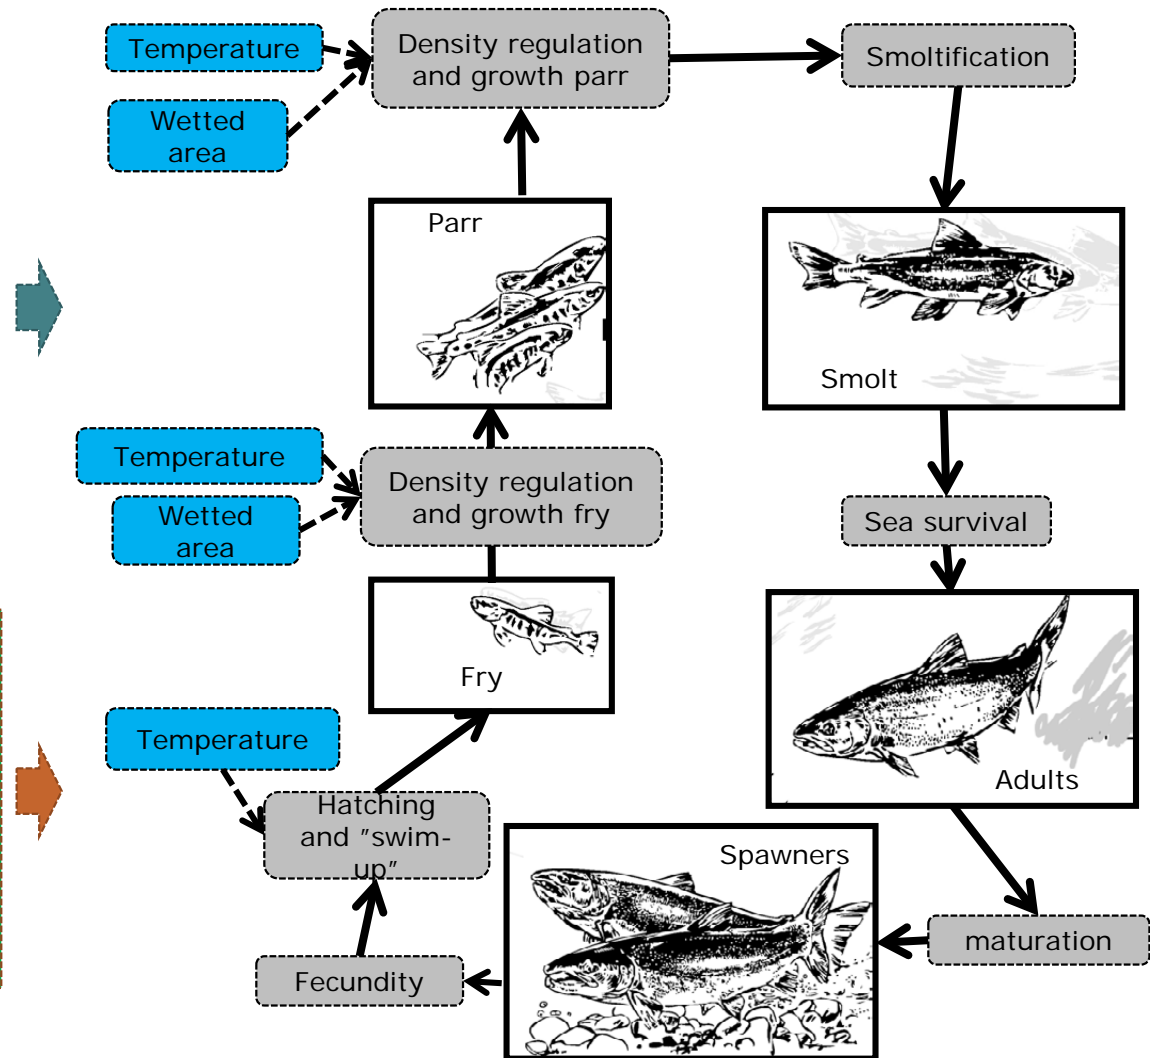

Gebre, Boissy & Alfredsen, *The Cryosphere Discussions* (in review)

IB-salmon

Abiotic input:
Water temperature
Wetted area per section (discharge)

Biological input:
Egg deposition (per section)
Habitat quality (each year)

L. Sundt-Hansen, R. Hedger, O. Ugedal, O. Diserud, A. G. Finstad, T. Forseth, L. Tøfte & J. Sauterleute

Smolt age control

Smolt age scenario

- Salmon juveniles grow faster, smoltify younger
- Increased mortality in summers due to reduction in wetted area
- **Reduced recruitment and reduced production of salmon in future scenario**

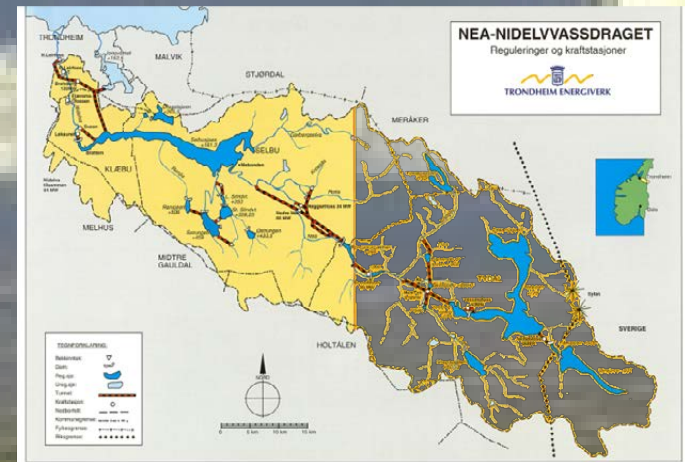

Hydrologisk modellering

Real world system

Object representation

Computational element

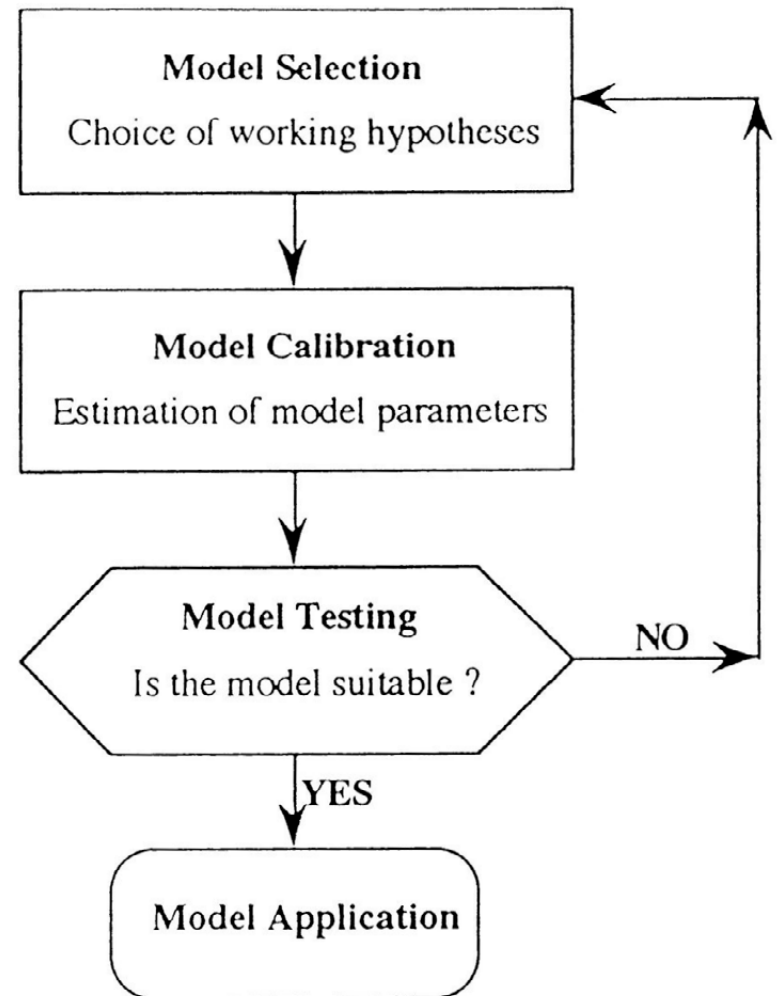

Enki:

- Rammeverk for modellutvikling
- Fordelte vs integrerte modeller
- FoU-versjon utviklet 2002-2014 ved SINTEF
- Operativ versjon utviklet 2014-2015 ved Statkraft
- Begge versjoner Open Source
- På vei inn i operasjonell programvare (Powel)

Model Development

- Model selection:
 - Operational needs
 - Dominant processes
 - Available data
- Validation
 - Required performance
 - Achievable performance
 - Physical correctness
 - Stability and robustness
- Two often quoted statements:
 - "All models are wrong. Some, however, are useful." (Box, 1979)
 - "A model must work well for the right reasons" (Klemes, 1986)

Simplification of response routines

HBV response + soil

- 8 parameters
- 3 states

3-par Kirchner + soil

- 6 parameters
- 2 states

2-par Kirchner

- 3 parameters
- 1 state (Q)

Performance (average R^2 of 22 catchments)

HBV response + soil

Regional cal: 0.679

Local cal: 0.741

3-par Kirchner + soil

Regional cal: 0.683

Local cal: 0.762

2-par Kirchner

Regional cal: 0.684

Local cal: 0.752

Energy-sum melt equation

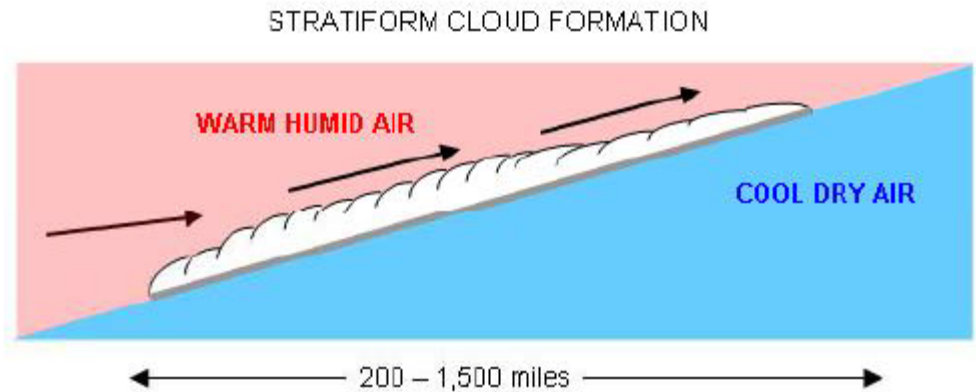

Proseses in land surface evaporation

Forms of precipitation

- Stratiform precipitation
 - Warm front
 - Cold front
- Convective precipitation
- Orographically enhanced precipitation

TOOLS: Routines for efficient analysis

- Et felles grensesnitt for
 - Hydrologiske modeller
 - Planleggingsmodeller
 - Miljømodeller
- Rutiner for datafangst
 - Klimascenarier
 - Reanalyse, varslingsgrid
 - Fjernmålingsdata
 - GIS-data
 - Punkt-måleserier
- Nedskaleringsrutiner
